Good old Giles Corey, a rhymer of "other days," who had a prophetic glimpse of our own times, relawhich we take the following:

"I saw a man pull all his teeth,
It took him but a minute;
He oped his mouth and put them back— I thought the deuce was in it!

"A limping man had lost his leg. A wooden one had he; To tell which leg the man had lost, Was quite too much for me. "I saw a man cut off a limb,

The surgeon's knife all gory,
But yet the patient felt no pain—"
"'Tis false!" sayde Goodey Corey. "'Twas in my dream I saw it, dame, I saw him take ye stitches, And then I knew I'd fell among A race of real witches.

"I met a man who'd lost an eye, And chose to have another-He beight one at ye nearest shop, Just like its living brother.

"I had a raging tooth to draw, (To you 'twill seem a fable,) I went to sleep-and then awake, And found it on ye table.

" I looked upon this wizard race

With still increasing wonder; They drew ye lightning from ye skies, And bottled up ye thunder. "They carried news by lightning teams, Made portraits with ye sun,

Used cotton for their gunpowder, To charge the sperting gun. " A magic substance they have found, And some ingenious lubber Makes everything (save consciences)
Of patent India Rubber.

" To light their homes with flaming air The elements they torture; And hope to get—by taking Paine's— Their candle-light from water.

"I told them that to see the world I had a strong desire-They took me off in vapory cloud And chariot of fire!

'Tis a prophetic gleam-

I only tell my dream."

I do not speak my waking thoughts,

"Full forty miles an hour they go, By power of nought but steam; And ships with wheels go swift." "Tis false!" Sayde Goodey with a scream. " Quoth Giles: "Remember, my good wyfe,

Alternation of Crops.

than the others, much potash though less than the others, and much silica. The ashes of all classes contain the various mineral elements, viz : sulphuric ted to his incredulous spouse a very long dream, from acid, phosphoric acid, chlorine, lime, magnesia, potash, soda, silica, iron, but in various, and many of them in very small proportions. The investigations so diligently pursued by men of

science, with reference to the nutrition of plants, may

result in developments which will realise the idea of Liebig, and take off from agriculture the "constraint" of alternation. Until this shall be done, however, the diligent application of the precepts lying at the foundation of the system, is to the practical man the surest guarantee of success .- American Furmer. A Few Words on Summer Fallows. The two principal objects of summer fallowing are, to clean the land, and to convert, by the admission of light and air, and by the comminution of the

particles of the soil, its inert matter into available food for plants. In light sandy soils, which adra the air readily at all times-and in which, consequently, there is but little dormant matter capable of speedy decomposition—a fallow is not followed by that increase of crops so observable on rich clay loams, which, without constant working, are impervious to the atmosphere. Farmers in old countries are well satisfied on this point, while with us every year seems to convince multitudes of its truth. We admit that sandy land produces better crops

for a few years when first tilled, than clay land, and that summer fallowing on such lands is attended with better results for a few years than on heavy loams. But after the organic matter of these light soils is removed—as under a system of summer fallowing it soon will be-the increase of crops from this process is materially lessened. Summer fallowing on sandy soil is simply accelerating the decomposition of organic matter and the disintegration of the mineral elements of plants in the soil, rendering them available, without increasing the quantity. On such soils, therefore, it must be considered an exhausting system of cultivation. On aluminous soils the case is different. Most

clays naturally contain an almost inexhaustible amount of the elements of plants, and the principal aim of the cultivator is to render these elements assimilable. Thorough pulverization enables him to do this to the best advantage; and we may questio whether the heavy land farmer will ever be able to dispense altogether with summer fallows. Clay land possesses the power of retaining the ammonia contained in the rain water which filters

through it; while sandy soils possess this power only in a slight degree, if at all. The obsolete idea of 'resting' land, was substituted When an underdrained, rich clay soil is summer

lem shall be solved, we may look for another revo- been under such a system of tillage, little increase o lution in agriculture. In the mean time, it will not fertility is gained by the decomposition and disinte gration of inert matter-since such soils contain com alternating system is based, that we may know at paratively little inert food for plants-and but a small least just where we are at present, and see that we proportion of the ammonia of rain-water is retained. make the best use of the lights we already have. - So that, while the heavy land farmer is under the necessity of performing much more heavy work, and of raising fewer crops than his sandy soil neighbor, yet he is not necessitated to use so much manure, and reaps frequently in one crop as much profit as the other does in two. Each class of soils, however, has its advantages and disadvantages, and in Great Britain since the extensive introduction of turnip culture, the light soils have been more profitable than the heavy soils which need summer fallowing.

Summer fallowing sandy soils is unwise; how, then should they be cultivated? Sow them to clover, peas, beans, lentils, rape, &c., and either plough in these crops or feed them to the cattle for sheep and return the manure. These plants take up the ammonia brought to the soil in rain water, and when ploughed in or eaten on the land, the ammonia is retained just as it is on the clays. In this way, clover, &c., is to the light soils what the double silicates are to the clays -the retainer of ammonia for the use of the following wheat crop.

On medium soils-such as abound in Western New York and Upper Canada--a blending of these two which admit of the ready growth of weeds among systems would appear judicious. This would be, growing as much clover, &c., as possible, eating a portion of it on the land, and breaking up about the last week in June, simply cultivating and harrowing it afterwards to keep it free of weeds and render it mellow. This practice is adopted to a great extent in Western New York, and is found much better and cheaper than several ploughings as in the old summer fallow system.

Even on heavy clay land, many intelligent farmers prefer turning under a crop of clover when in bloom in this way rather than to summer fallow proper .--ated during its decomposition, serve both to enrich and ameliorat the soil. How far this practice is culmiferous are supposed most rapidly to exhaust capable of superseding the old summer fallow, expe-Board (everything included) can be had at from \$9 to \$10 supplies—this class embraces wheat, rye, oats, bar-rience only can decide. One of the great wants of our system of rotation is a fallow crop. A crop which, while it impoverishes the soil but little, permits the free use of the cultivator and hoe during summer; a crop that shall be to us what the turnip is to English farmers: a crop, in a word, that shall enable us to clean our land as well as though it was summer fallowed, that furnishes a large amount of nutritious food, and which, when consumed on the farm and the manure made from it returned to the soil, shall leave the land rich in ammonia for the use of the following cereal crops: Indian corn admirably answers the two first requisites, but we fear it consumes or destroys as much ammonia as wheat, and that therefore, it is not a true fallow crop. Beans come nearer our requirements than any other crop we are acquainted with, and it is surprising that they are not more extensively grown on all wheat farms .- Country Gen-
